

Relaxation in its purest form

SpaTime – the new range of spa water care products

spa)time™
by BAYROL

A woman with long dark hair is relaxing in a hot tub, looking towards the camera with a slight smile. In the foreground, a dark grey spa control panel is visible. The background shows a blurred indoor setting with a wooden chair and a blue vase containing green plants. The page is divided into two sections by a white curved line, with a blue circular graphic element on the right side.

Timeout begins with relaxation

The magical power of hot springs has been used for the well-being of mind, body and soul for centuries. It was tradition for the Greeks and the Romans to stimulate tired muscles and the stressed spirit by bathing in hot water. Today this function is performed by modern spas. With their multitude of functions they guarantee a healthy timeout.

To protect your health and to maintain your investment, the water in your spa requires the appropriate care. SpaTime is a BAYROL product range matched specifically to these requirements and takes into account the special conditions in your spa. For instance, the high water temperatures and jets, pose a particular challenge when it comes to water care. In addition, the restricted pipe work system encourages the reproduction and settling of organic substances that should not be in the spa.

SpaTime offers discerning spa owners easy-to-use, harmonised care products to keep the water in your spa clear, fresh and perfectly hygienic at all times.

Well-being with well-maintained water

Well being is also about the right water quality and the right balance. The pH value which affects the longevity of your spa, the efficacy of the water care products and your well-being should be maintained between 7.2 – 7.6. Total alkalinity (TA) contributes towards the water quality and balance and should be checked regularly. To avoid undesired effects, quality issues and balance problems these values should be checked at least once per week and more often after a fresh fill. It is also important to note that the warm water of the spa tends to naturally increase the level of the pH and can result in calcium precipitations leading to turbidity in the water.

SpaTime offers you an unbeatable product range that ensures an ideal water equilibrium and hardness stabilisation.

Impeccable hygiene

You don't want organic substances such as bacteria or fungi to ruin your relaxation in the spa. Although only a few bacteria and fungi present a risk of infection to bathers, they can reproduce rapidly to make the water slimy and turbid.

SpaTime, with various disinfection methods, guarantees to effectively disinfect your spa water so that every single drop remains perfectly hygienic. Available treatment methods are chlorine, bromine and chlorine-free based on active oxygen.

Convenient: „Spa Pure“ in pre-measured sachets for simple dosing

A pristine spa guarantees the ultimate bathing experience

Besides disinfection and pH value regulation, spas need from time to time additional care and cleaning for the purest bathing: from removing calcium precipitations from pool walls and pipe work, to preventing foam after switching on the jets. You can rely on a broad range of SpaTime cleaning products to ensure superior care of your spa.

Your bespoke spa set

Spa water care greatly depends on the individual user preferences as well as local water quality. SpaTime can fulfil all of your requirements: your specialised dealer will be delighted to compose your bespoke spa set – to suit your needs concerning treatment method and water balance. This ensures that all products required for optimum water care are at your fingertips and available from the start.
